

# High Level Design Document

## Introduction

This High Level Design (HLD) document outlines the architecture and core components for **ClusterVision - Customer Segmentation Visualizer**. The project is a Streamlit-based tool enabling users to perform K-Means clustering on retail customer data, visualize clusters, and evaluate clustering quality using Elbow and Silhouette methods. The tool provides interactive visualizations and exportable results.

## 1. System Architecture Overview

### Architecture Summary:

ClusterVision is a modular, client-server web application built with Streamlit. It processes user-uploaded data, applies unsupervised clustering, visualizes results, and allows data export.

| Module              | Role                                                               |
|---------------------|--------------------------------------------------------------------|
| User Interface (UI) | Collects user input, displays visualizations, manages interactions |
| Data Processing     | Loads, validates, and preprocesses customer data                   |
| Clustering Engine   | Performs K-Means clustering, computes Elbow & Silhouette metrics   |
| Visualization       | Generates interactive cluster plots and evaluation charts          |
| Export Module       | Enables export of clustered data and visualizations                |

## 2. Component Interactions

| Sequence Step              | Interaction Description                                                    |
|----------------------------|----------------------------------------------------------------------------|
| 1. User uploads data       | UI → Data Processing: Data is uploaded and validated                       |
| 2. Data preprocessing      | Data Processing → Clustering Engine: Cleaned data is passed for clustering |
| 3. Clustering & evaluation | Clustering Engine: Runs K-Means, computes metrics                          |
| 4. Visualization           | Clustering Engine → Visualization: Results sent for plotting               |
| 5. User interaction        | UI ↔ Visualization: User explores clusters, adjusts parameters             |
| 6. Export results          | UI → Export Module: User exports clustered data/plots                      |

## 3. Data Flow Overview

| Data Source/Target | Data Type      | Flow Description              |
|--------------------|----------------|-------------------------------|
| User → UI          | CSV/Excel data | User uploads customer dataset |

|                                     |                         |                                         |
|-------------------------------------|-------------------------|-----------------------------------------|
| UI → Data Processing                | Raw data                | Data is validated and preprocessed      |
| Data Processing → Clustering Engine | Cleaned data            | Data used for clustering and evaluation |
| Clustering Engine → Visualization   | Cluster labels, metrics | Data for plots and evaluation charts    |
| Visualization → UI                  | Plots, tables           | Interactive display to user             |
| UI → Export Module                  | Clustered data/plots    | User exports results                    |

---

## 4. Technology Stack

| Layer/Function   | Technology/Framework                      |
|------------------|-------------------------------------------|
| Web UI           | Streamlit                                 |
| Data Processing  | Pandas, NumPy                             |
| Machine Learning | scikit-learn (KMeans, metrics)            |
| Visualization    | Streamlit, Matplotlib/Plotly              |
| Export           | Pandas (to CSV/Excel), Streamlit download |
| Language         | Python 3.x                                |

---

## 5. Scalability & Reliability

- **Scalability:** Designed for moderate datasets; can be containerized for deployment. For large-scale or concurrent users, deploy behind a WSGI server or scale horizontally.
- **Reliability:** Input validation and error handling ensure robust operation. Stateless design allows easy recovery and redeployment.
- **Security:** User data is processed in-memory and not persisted; recommend secure deployment practices for sensitive data.
